$RSA_{2048}$  is a 617 (decimal) digit number

<http://www.rsa.com/rsalabs/challenges/factoring/numbers.html/>

$$RSA_{2048} = p \cdot q, \quad p, q \approx 10^{308}$$

**PROBLEM:** Compute  $p$  and  $q$

PRICE OFFERED ON MARCH 18, 1991: 200.000 US\$ ( $\sim 232.700.000$  Iraq Dinars)!!

**Theorem.** If  $a \in \mathbb{N}$   $\exists!$   $p_1 < p_2 < \dots < p_k$  primes  
s.t.  $a = p_1^{\alpha_1} \dots p_k^{\alpha_k}$

**Regrettably:** RSAlabs believes that factoring in one year requires:

number	computers	memory
$RSA_{1620}$	$1.6 \times 10^{15}$	120 Tb
$RSA_{1024}$	342,000,000	170 Gb
$RSA_{760}$	215,000	4Gb.

<http://www.rsa.com/rsalabs/challenges/factoring/numbers.html>

Challenge Number	Prize (\$US)
$RSA_{576}$	\$10,000
$RSA_{640}$	\$20,000
$RSA_{704}$	\$30,000
$RSA_{768}$	\$50,000
$RSA_{896}$	\$75,000
$RSA_{1024}$	\$100,000
$RSA_{1536}$	\$150,000
$RSA_{2048}$	\$200,000

<http://www.rsa.com/rsalabs/challenges/factoring/numbers.html>

Numero	Premio (\$US)	Status
$RSA_{576}$	\$10,000	Factored December 2003
$RSA_{640}$	\$20,000	Factored November 2005
$RSA_{704}$	\$30,000	Factored July, 2 2012
$RSA_{768}$	\$50,000	Factored December, 12 2009
$RSA_{896}$	\$75,000	Not factored

$RSA_{1536}$	\$150,000	Not factored
$RSA_{2048}$	\$200,000	Not factored

The RSA challenges ended in 2007. RSA Laboratories stated:

*“Now that the industry has a considerably more advanced understanding of the cryptanalytic strength of common symmetric-key and public-key algorithms, these challenges are no longer active.”*

## Famous citation!!!

*A phenomenon whose probability is  $10^{-50}$  never happens, and it will never be observed.*

## History of the “Art of Factoring”

220 BC Greeks (Eratosthenes of Cyrene)

## History of the “Art of Factoring”

1730 Euler  $2^{2^5} + 1 = 641 \cdot 6700417$

## How did Euler factor $2^{2^5} + 1$ ?

PROPOSITION Suppose  $p$  is a prime factor of  $b^n + 1$ . Then

1.  $p$  is a divisor of  $b^d + 1$  for some proper divisor  $d$  of  $n$  such that  $n/d$  is odd or
2.  $p - 1$  is divisible by  $2n$ .

*Application:* Let  $b = 2$  and  $n = 2^5 = 64$ . Then  $2^{2^5} + 1$  is prime or it is divisible by a prime  $p$  such that  $p - 1$  is divisible by 128.

Note that

$$1 + 1 \times 128 = 3 \times 43, \quad 1 + 2 \times 128 = 257 \text{ is prime,}$$

$$1 + 3 \times 128 = 5 \times 7 \times 11, \quad 1 + 4 \times 128 = 3^3 \times 19 \text{ and } 1 + 5 \cdot 128 = 641 \text{ is prime.}$$

Finally

$$\frac{2^{2^5} + 1}{641} = \frac{4294967297}{641} = 6700417$$

## History of the “Art of Factoring”

$$1730 \text{ Euler } 2^{2^5} + 1 = 641 \cdot 6700417$$

## History of the “Art of Factoring”

1750–1800 Fermat, Gauss (Sieves - Tables)

## History of the “Art of Factoring”

1750–1800 Fermat, Gauss (Sieves - Tables)

Factoring with sieves  $N = x^2 - y^2 = (x - y)(x + y)$

## Carissan's ancient Factoring Machine

579098734950144178863178946295187237869221823983

Date: Mon, 9 May 2005 18:05:10 +0200 (CEST) From: "Thorsten Kleinjung" Subject: rsa200

We have factored RSA200 by GNFS. The factors are

35324619344027701212726049781984643686711974001976 25023649303468776121253679423200058547956528088349

and

79258699544783330333470858414800596877379758573642 19960734330341455767872818152135381409304740185467

We did lattice sieving for most special  $q$  between  $3e8$  and  $11e8$  using mainly factor base bounds of  $3e8$  on the algebraic side and  $18e7$  on the rational side. The bounds for large primes were  $2^{35}$ . This produced  $26e8$  relations. Together with  $5e7$  relations from line sieving the total yield was  $27e8$  relations. After removing duplicates  $226e7$  relations remained. A filter job produced a matrix with  $64e6$  rows and columns, having  $11e9$  non-zero entries. This was solved by Block-Wiedemann.

Sieving has been done on a variety of machines. We estimate that lattice sieving would have taken 55 years on a single 2.2 GHz Opteron CPU. Note that this number could have been improved if instead of the PIII- binary which we used for sieving, we had used a version of the lattice-siever optimized for Opteron CPU's which we developed in the meantime. The matrix step was performed on a cluster of 80 2.2 GHz Opterons connected via a Gigabit network and took about 3 months.

We started sieving shortly before Christmas 2003 and continued until October 2004. The matrix step began in December 2004. Line sieving was done by P. Montgomery and H. te Riele at the CWI, by F. Bahr and his family.

More details will be given later.

F. Bahr, M. Boehm, J. Franke, T. Kleinjung

## Great Internet Mersenne Prime Search (GIMPS)

The Great Internet Mersenne Prime Search (GIMPS) is a collaborative project of volunteers who use freely available software to search for Mersenne prime numbers (i.e. prime numbers of the form  $2^p - 1$  ( $p$  prime)).

The project was founded by George Woltman in January 1996.

## The AKS deterministic primality test

Solves #1 open question in computational number theory

<http://www.cse.iitk.ac.in/news/primality.html>

## How does the AKS work?

**Theorem. (AKS)** Let  $n \in \mathbb{N}$ . Assume  $q, r$  primes,  $S \subseteq \mathbb{N}$  finite:

- $q|r - 1$ ;
- $n^{(r-1)/q} \bmod r \notin \{0, 1\}$ ;
- $\gcd(n, b - b') = 1, \quad \forall b, b' \in S \text{ (distinct)}$ ;
- $\binom{q + \#S - 1}{\#S} \geq n^{2\lfloor \sqrt{r} \rfloor}$ ;
- $(x + b)^n = x^n + b$  in  $\mathbb{Z}/n\mathbb{Z}[x]/(x^r - 1), \quad \forall b \in S$ ;

Then  $n$  is a power of a prime

Bernstein formulation

**Fouvry Theorem (1985)**  $\Rightarrow \exists r \approx \log^6 n, s \approx \log^4 n$   
 $\Rightarrow$  AKS runs in  $O(\log^{15} n)$   
 operations in  $\mathbb{Z}/n\mathbb{Z}$ .

Many simplifications and improvements: **Bernstein, Lenstra, Pomerance.....**

## Another quotation!!!

*Have you ever noticed that there's no attempt being made to find really large numbers that aren't prime. I mean, wouldn't you like to see a news report that says "Today the Department of Computer Sciences at the University of Washington annouced that  $2^{58,111,625,031} + 8$  is even". This is the largest non-prime yet reported.*

- UNIVERSITY OF WASHINGTON (BATHROOM GRAFFITI)
